The solubility of benzene in compressed nitrogen was studied at temperatures from 35° to 100°C and pressures up to 1100 kg/sq cm. The shape of the solubility curve of the substance in the compressed gas is discussed qualitatively. It was proved experimentally that on the solubility curve of benzene in compressed nitrogen there is not only a minimum, but also a point of inflexion. With increasing pressure, the partial molar volume of benzene dissolved in nitrogen passes through a minimum. (Author)

The equilibrium constant for the isomerization of allene
has been calculated by the statistical method, from the

discussed, and it is concluded that, owing to the experi-

trustworthy. An error in the estimation of the entropy
of allene given by Linnett and Avery is corrected.

Trans. of Acta Physicochimica U. R. S. S., 1944,
v. 19, p. 225-247.

DESCRIPTORS: *Nickel catalysts. Nickel compounds,
Oxides, Carbonates, Decomposition.

The decomposition of nickel carbonate is shown to
proceed as an autocatalytic process. The reaction
velocity increases with rising reaction supersaturation.
An extremely rapid decay of carbonate is observed at
partial pressures of carbon dioxide from 10^{-4} to 10^{-2}
mm Hg, and a rather slow one near equilibrium. It is
shown that the values of the reciprocals of the lapse of
time, necessary to reach a certain degree of decompo-

PHOTOPOLYMERIZATION OF VINYL ACETATE.
[1961] 7p. 13 refs.

Trans. of Acad. Sci. USSR Div. Chem. Sci., 1944,
v. 19, p. 265-285.

DESCRIPTORS: *Acetates, *Vinyl radicals, Photo-
chemistry, Polymerization.

The photopolymerization of vinyl acetate in mixtures
with ethyl acetate and benzene has been investigated.
The rate of photopolymerization of pure vinyl acetate
and in mixtures with ethyl acetate is proportional to the
square root of the intensity of incident light. A peculiar
relation is established between the ratio V/V_0 and the
concentration of vinyl acetate. The temperature de-
pendence of the rate of polymerization corresponds to
an activation energy of 6.3 kg cal. The length of the
molecular chain is shown to be proportional to the

DESCRIPTORS: *Knocking, *Internal combustion
engines, *Ignition.

It is shown that the specific distinction between knocking and antiknocking fuels consists in the occurrence in the former of a cool flame and two-stage autoignition region, whereas in the latter only a region of single-stage autoignition of the degenerate explosion type is manifested. (Author)

OXIDATION AND POLYMERIZATION OF STYRENE.

DESCRIPTORS: *Styrenes, Polymerization, Oxidation,
Free radicals.

Experiments showed that styrene oxidation comprises
two chain processes, a primary and a secondary one,
which take place with the intermediate formation of
peroxide compounds. The formation of secondary
chains is due to the decomposition of oxyperoxides
formed from the unstable peroxides of benzaldehyde and
styrene. Propagation of both chain processes occurs
through free radicals. The ratio of oxidized to poly-
merized styrene remains constant at different tempera-
tures, with admixture of benzaldehyde and benzoyl
